

INDUSTRIAL CASE STUDY

The Business Case

An international industrial end user comprising manufacturing and warehouse/despatch buildings. A heavy energy user with an existing lighting system that is on 24hrs/day. A wide variety of fittings, technologies and power/lighting outputs throughout. Generally old and ineffective fluorescents and 400W metal halide high bays.

Lighting across multiple areas has been considered poor and uneven, posing H&S risks to colleagues. A combination of high energy usage/costs through ageing fittings, along with long operational hours and areas of infrequent use makes for an excellent commercial business case that far surpasses the customer's requirements.

AOne™
SMART LIGHTING SPACES

Controlled via
Bluetooth®

Utilising our smart integrated AOne™ system we are able to achieve these savings through schedules and smart PIR along with granular control.

Smart Energy Saving | Improved Working Environment

Case Study

SUCCESS CRITERIA

- Reduce lighting energy bills by >50%
- Achieve an aggressive project RoI <2 years
- Reduce operational maintenance costs over the warranty period

Project: International Industrial End User

- Improve operational efficiency by delivering a smart lighting solution with improved light quality, consistency and coverage across agreed areas

The Solution - £300,000 Smart Lighting Project

Aurora's AOne™ smart lighting spaces is a wireless lighting control system offering simple installation and commissioning.

Mesh networking of connected luminaires and sensors enables easy grouping and configuration, with immediate and significant energy savings through daylight harvesting and occupancy-based control.

This ensures the most efficient use of energy to provide the correct amount of autonomous light when and where it is needed.

Almost 900 smart luminaires optimising energy savings based on how the building and colleagues operate. Making your buildings a key part of your business.
